28. Estimated percentage of American Pima cotton acreage planted to specified varieties, by states, 1974-1978.	27
29. Estimated percentage of American Pima cotton acreage planted to specified varieties, by marketing services office areas, crop of 1978.	27

Cotton Varieties Planted, United States
1974-1978

Stoneville and Deltapine were the leading varieties of cotton planted in the United States in the 1978-79 season, according to the Cotton Division, Agricultural Marketing Service, USDA. Each of these varieties accounted for nearly one-fifth of the national upland acreage. Lankart was the third leading variety, planted on about one-seventh of the acreage. Acala was fourth at about one-eighth of the acreage planted. The fifth and sixth leading varieties were Paymaster and Tamcot, respectively, and together these varieties made up a little less than one-eighth of the acreage planted in 1978.

Stoneville and Deltapine were the two leading varieties planted in the United States this season. Each accounted for about 18 percent of the acreage planted. A year earlier, Stoneville made up 23 percent of the acreage planted while Deltapine was second at 18 percent. Stoneville was the leading variety planted this year in Alabama, Mississippi, Tennessee, Missouri and Arkansas. Deltapine was the leading variety in Florida, Louisiana and Arizona. Stoneville 213 was the leading Stoneville strain, accounting for 16 percent of the U.S. acreage. Deltapine 61 and Deltapine 16 were the two most popular Deltapine strains, making up nine and six percent of the U.S. acreage, respectively.

Lankart was the third leading variety this year at 14 percent of total acreage. A year earlier, Lankart accounted for 12 percent of the acreage. Lankart was the leading variety planted in Oklahoma and Texas.

Acala, the fourth leading variety, comprised 13 percent of planted acreage this season, up from 10 percent a year earlier. Acala was the principal variety planted in New Mexico and California.

Paymaster was the fifth leading variety, comprising seven percent of this year's acreage. A year earlier, Paymaster made up nine percent of the acreage. Paymaster was the second most popular variety in Texas.

The sixth leading variety was Tamcot. This variety represented five percent of acreage this season, the same as a year earlier. Tamcot was the third leading variety planted in Texas, comprising 10 percent of the Texas acreage. Tamcot was widely planted in the earlier producing sections of Texas.

Pima S-5 remained the leading strain of American Pima cotton planted in 1978, accounting for 97 percent of the acreage. This was the third consecutive year that Pima S-5 was the leading strain, rising from 10 percent in 1975, to 80 percent in 1976 and to 94 percent last season. Pima S-5 accounted for virtually all of the American Pima acreage planted in New Mexico, Texas and the Phoenix area of Arizona.

Estimates of the percentages of the various varieties of cotton planted in the United States in 1978, by counties, Marketing Services Office areas, and states are presented in this report. Comparative variety data for the four years 1974-77 are shown by states. The variety data are based primarily on estimates furnished by cotton ginners for the territories served by their gins.

Estimated percentage of cotton acreage planted to specified varieties, United States,
1974-1978

Year	Acala	Deltapine	Lankart	Paymaster	Stoneville	Tamcot	Other	Total

^{1/} Compiled from "Summary of Cotton Fiber and Spinning Test Results, Crop of 1977", USDA, AMS, Cotton Division, August 1978.

^{2/} Micronaire reading is a measure of fiber fineness and maturity. This test measures resistance of a plug of cotton to air flow.

^{3/} Fiber strength indicates ability of cotton fibers to withstand force or tension, and has a strong bearing on spinning utility. Zero gage fiber strength test made without a spacer between clamp jaws using Pressley flat bundle tester. 1/8" gage strength test made with 1/8" spacer between clamp jaws using Stelometer and results are adjusted to the Pressley level.

^{4/} Digital Fibrograph 2.5% span length indicates length spanned by 2.5 percent of the fibers when they are parallel and randomly distributed. This measure is closely related to staple length designations. Digital Fibrograph 50/2.5 uniformity ratio values indicate relative uniformity of fiber length in samples.
